Software

- VisIt (participant since inception in 2000, project architect 2000-2013)
 - VisIt is developed by over a dozen developers, is used at supercomputing centers around the world, has been downloaded more than *200,000* times, and was recognized with an R&D 100 award in 2005.
 - Childs designed and implemented the initial version of the library for VisIt's parallelized large data handling. This library addressed key data model issues, data flow paradigms, parallelization models, and visualization and analysis algorithms. The library is now more than 350,000 lines of code and worked on by many developers.
- VTK-m (participant since inception in 2016)
 - VTK-m is a library for portable performance over many-core architectures. It is a follow-on effort to the popular Visualization ToolKit (VTK), with the "m" indicating many-core support.
 - In collaboration with his students and colleagues, Childs has helped design and implement multiple data parallel primitive-based algorithms in VTK-m, including external facelist calculation, ray tracing, unstructured volume rendering, wavelet compression, point merging, Markov Random Fields for computer vision, maximal clique enumeration, hash tables, mesh quality metrics, and particle advection.
- Ascent (participant since inception in 2017)
 - Ascent is a flyweight library for in situ visualization and analysis, with emphases on minimal memory usage and API, as well as interoperability with external libraries.
 - Ascent has primarily been developed by Ph.D. alumnus Matthew Larsen, starting during his time as a student in the group (with its predecessor name, Strawman), and with the majority of development happening by Larsen after graduation. Childs has advised various student activities in the project. As an individual, Childs' biggest contribution to Ascent has been developing tutorial materials for the project.
